

CLEANING INSTRUCTIONS
KEG KING
SLURPEE/DAQUIRI MACHINE

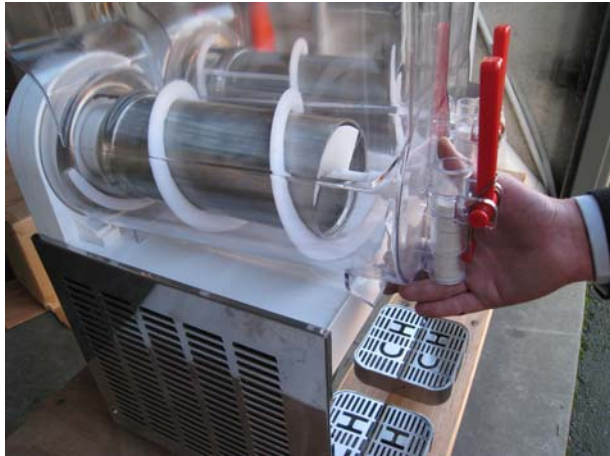

Step 1 – Washing the tanks

Turn off the machine and unplug from the power point. Empty the tanks and wash out with warm soapy water.

Step 2 – Dismantling the tanks

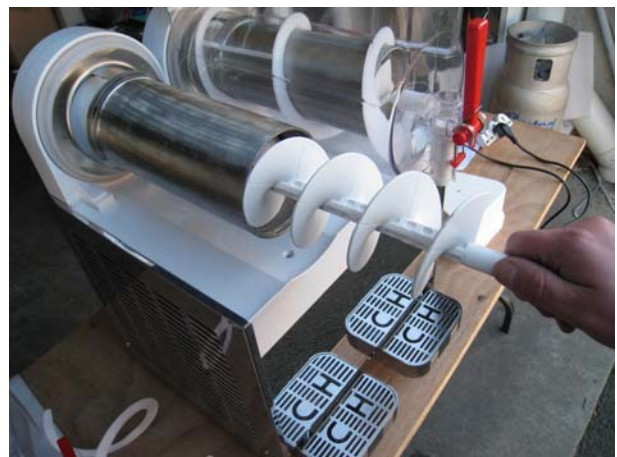

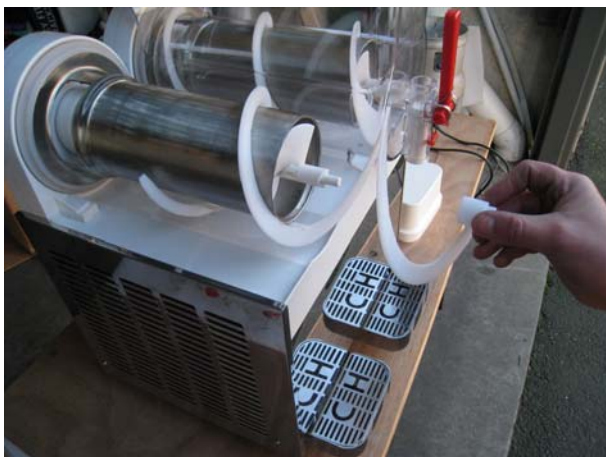

Put your hands underneath the front of the tank and firmly lift up. After this, the tanks should become loose and gently slide away from the main machine body.

Step 3 – Dismantling the spindle.

Next, take the outer spindle off the refrigeration tube, then take the inner spindle out from inside the refrigeration tube.

NOTE: the inner spindle will require some force as it is under magnetic force with the drive shaft.

Step 4 – Dismantling the tap

Pull out the pivot pin from the side of the tap.

Once the pin is out the tap handle and assembly will come out for easy washing.

NOTE

When replacing the tank, make sure that the seal at the back is correctly in place and not kinked. A kinked seal will cause leaking.
